

## SolarInvert Energy Solutions

# Can energy storage devices prevent islanding

## Overview

---

What if solar islanding wasn't prevented?

Here's what could happen if solar islanding wasn't prevented: The local grid goes down. However, your grid-tied solar power system still produces electricity. Once the panels have supplied electricity to your home, any excess energy goes into the grid.

What is islanding in electricity?

What is Islanding?

Islanding is a condition that occurs when a distributed energy resource (DER) such as a grid-tied inverter continues to supply power to a section of the grid that has been disconnected from the main grid. There are two types of islanding: unintentional and intentional.

What is islanding & how to protect from it?

Islanding: what is it and how to protect from it?

Islanding is a critical and unsafe condition in which a distributed generator, such as a solar system, continues to supply power to the grid while the electric utility is down. Islanding is a critical and unsafe condition, which may occur in a power system.

How does an islanding solar inverter work?

Your islanding solar inverter works independently from the power grid. If there's a storm or other event that knocks out the main power grid, your solar power system will continue running and providing power to your home. We mention this because many people mistake going solar with going off-grid, but that's typically not the case.

Can your home be a solar energy island?

However, your home can be a solar energy island with renewable energy available during a power outage or blackout. Integrating a solar inverter with island mode and battery storage will give you this capability while maintaining a connection to the grid.

Why should you choose An islanded Solar System?

On the one hand, it will enable you to continue to power your home with locally-produced solar generation even in the event of a grid outage. On the other hand, an islanded system has no risk of pushing excess electricity onto the grid, making it safe for utility workers to work to restore regular service.
