Energy storage price export

Overview

Is China's energy-storage sector still reeling from a price war?

Photo: Handout China's energy-storage sector is still reeling from a relentless price war after years of overproduction. Overall capacity in the new-type energy-storage sector rose by almost 10 times between 2020 and 2023, the National Energy Administration said last week.

Will US tariffs affect energy storage?

There have also been indications that the US administration may consider other tariff proposals impacting energy storage, such as a 10-20% universal tariff, tariffs of up to 60% across the board on Chinese-origin goods, and tariffs of 25% on Mexican and Canadian origin goods.

How much did energy storage cost in China in 2023?

The global energy storage market nearly tripled in 2023 alone, adding 45 gigawatts (97 gigawatt-hours), yet prices in China fell to record lows of \$115 per kilowatt-hour for two-hour systems—a 43% year-over-year decrease.

Which international trade issues will remain a concern for energy storage projects?

Two major areas of international trade that will remain causes of concern for energy storage projects are the application of tariffs and supply chain integrity.

What is EnergySource?

EnergySource is the Global Energy Center's (GEC) online publication providing commentary and analysis on developments in the energy and climate sector from a wide-array of thought leaders, politicians, and experts.

Are battery exports increasing or decreasing in China?

Chinese trade data shows that battery exports by weight have increased year-over-year, while their export value has declined. In 2024, the United States imported 923,000 tons, slightly less than the EU's 938,000 tons. However, comparing volumes has limitations since batteries vary widely in function and are not interchangeable commodities.
