# How many watts of off-grid solar panels are needed for home use

## Overview

---

You'll need 15-30 solar panels to run a house off-grid, depending on your energy use, sun hours, and panel wattage. Most off-grid homes need 15-30 solar panels based on daily energy use. Each panel generates around 1.5 kWh per day on average. How many solar panels do you need to run an off-grid home?

The number of solar panels you need to run an off-grid home depends on your energy usage. If you fall around the average 7 kW, you'd need over 20 solar panels of at least 325 watts. Planning an off-grid solar system can be tricky, but it doesn't have to be disheartening.

How many batteries do I need to run a house off-grid?

As a rule of thumb, it takes upward of eight batteries to go fully off-grid. The size of your battery bank ultimately comes down to your individual energy usage, which can be determined using our calculator above. How Many Solar Panels Do I Need to Run a House Off-Grid?

.

How many solar panels do I Need?

So, about four 250-watt solar panels should be able to fully charge our battery bank over the course of the day. Of course, we want to leave room for inefficiencies and changes in the weather, so we're going to install five solar panels just to be safe.

Should I use 12V or 24V solar?

Small systems, such as those on an RV or boat, should use 12V systems, while larger solar arrays do best with 24V. A good rule of thumb is that if your energy needs are less than 1,000 watts, go for a 12V system. If you use between 1,000 and 3,000 watts, then a 24V system is best.

How do I sizing an off-grid Solar System?

We developed an off-grid solar system calculator to help you determine what size system you need. Sizing an off-grid solar system takes precision, but it's still relatively simple. Follow the steps below to use our off-grid solar system sizing calculator: Enter the ZIP code where you will install your system.

When should I size my solar panels?

If the amount of sunlight drops significantly during the winter months, then you should size your solar panels based on the least amount of sunlight available during the year. If the available sunlight drops by half to 2.5 hours a day during the winter, then we would double the size of our PV array to 10 panels.
