Introduction to Solar System

Overview

The Solar System consists of the Sun and the objects that orbit it. The name comes from Sōl, the Latin name for the sun. It was when a dense region of a protostar collapsed, creating the Sun and a protoplanetary disk from which the orbiting bodies assembled. The fusion of hydrogen into helium inside the Sun's core releases energy, which is primarily emitted through its outer layers. This creates a decreasing temperature as distance from the Sun increases.
