

## SolarInvert Energy Solutions

**Is there an emergency power supply for the rooftop base station**

## Overview

---

What equipment should be included in an emergency power system?

This includes the generator and all electrical distribution equipment that is part of the emergency system, transfer switches, feeders, panel boards, fuel tanks, and controls. In addition, all critical equipment that the emergency power system supplies must be elevated. Flood risk considerations should not be limited to the emergency power systems.

What are emergency and standby power systems?

For many facilities, an outage of even a minute can result in the loss of millions of dollars — or worse, put human lives at risk. emergency and standby power systems — outlines requirements for the installation and performance of backup power systems in emergency and legally required applications, where an outage would pose a life safety risk.

What is emergency power system NFPA 110?

NFPA 110: Standard for Emergency and Standby Power Systems includes two important definitions for emergency systems, emergency power supply, or EPS, and emergency power supply system, or EPSS. EPS is “the source of electric power of the required capacity and quality for an emergency power supply system,” which is often the generator itself.

What is an emergency power supply (EPS)?

Essentially, the emergency power supply (EPS) is the source of electrical power (i.e., generator) used in your backup power system (3.3.3). It is independent of your primary source of power, ready to kick on in case of power failure. Within the confines of this particular guide, when we refer to an EPS, we are talking about a standby generator.

What systems need emergency power?

Combined systems: With combined hydronic and force air systems,

emergency power is needed for the boilers, circulating pumps, air handling units, and HVAC controls. Emergency power to ventilation systems and make-up water systems may also be needed. Air conditioning systems mechanically cool the interiors of buildings.

Why do emergency power systems need protected locations?

Protected locations are imperative for the entire emergency power system and the equipment it serves, which take into account local conditions of the facility. Each component of the system should be evaluated in conjunction with expected hazards and by understanding how each interrelated component impacts another.

## Is there an emergency power supply for the rooftop base station

---

### Maintaining Backup Power to Critical Systems

Install an emergency generator above the Design Flood Elevation. Larger, high-rise residential buildings are typically required to have backup power for critical functions, such as the ...
