Portable power bank with a few kilowatt-hours of electricity

Overview

What is the difference between a power bank and power station?

A power bank is a small, portable device that's used to charge electronic products like smartphones, laptops and more. On the other hand, a power station can store huge amounts of energy to power electrical appliances like mini-fridges, microwaves and more. Can a portable power station be your home backup?

The answer, surprisingly, is yes.

How much power does a power bank provide?

Most power banks are designed to provide up to 25W of power. However, smaller power banks will likely deliver less than that. We have found in our testing that an output rating of 15W-25W is the sweet spot. In that range, you will get efficient power delivery and quicker charging times on the go.

What is the best portable power bank?

If the only thing you need to keep powered up is your cell phone, the Nimble Champ is the best option. This compact little power bank doesn't have any of the features found in bigger portable power stations, but it's small, easy to carry, and is made from recycled materials—including sustainable packaging.

How long does a portable power station last?

A portable power station's lifespan depends on the type of battery inside. Most new portable power stations, including all the models we recommend here, feature LiFePO4 battery technology, which lasts far longer than older lithium-ion technology. How much more?

LiFePO4 power stations will last for more than 3,000 charge cycles, or about 10 years.

How do power banks work?

Some power banks attach directly to smartphones via magnetic connection. These power banks are compact units that typically pack just enough power to recharge a compatible smartphone a single time. On this list, the Hinovo Magnetic Charger is a highly functional and convenient option. It essentially doubles your phone's battery — no cable required.

What can a portable power station charge?

All portable power stations can charge up small gadgets like phones and laptops or be used to power lighting. Most can handle small appliances like mini-fridges or TVs. If you want to use power tools, an AC unit, or in the UK, a kettle, you need to be able to draw thousands of watts.
