# What to put in the base station power cabinet

## Overview

---

What is a base station power cabinet?

The base station power cabinet is a key equipment ensuring continuous power supply to base station devices, with LLVD (Load Low Voltage Disconnect) and BLVD (Battery Low Voltage Disconnect) being two important protection mechanisms in the power cabinet.

What happens if you put a base station in a cabinet?

Placing your Base Station in a cabinet, closet, or around dense materials (such as granite, concrete, or metal) can weaken its signal to other SimpliSafe devices. This can lead to communication errors between the Base Station and your SimpliSafe products, and cause the other devices (sensors, cameras, etc.) to become unresponsive or go offline.

Where should a base station be placed?

The Base Station should be placed in a centrally-located area within your home or business, and in an open space. It is recommended that the Base Station is elevated at least 3 feet off the ground on a non-dense surface (ideally glass or wood). The following floorplan illustrates the recommended placement for a Base Station within this layout.

Why are base stations important?

In modern communication networks, base stations, as core infrastructure, are crucial for stable operation.

Can a base station be installed next to a router?

Installing your Base Station next to devices that output a wireless signal, such as a router or TV, is also not recommended. This can cause wireless interference and decrease the overall signal strength of the Base Station. Was this helpful?
